

Integration is essential, which is why Thomson Reuters HighQ provides a range of connectors to key systems, including Microsoft® SharePoint, iManage Work, Active Directory®, SQL Server®, and many more, to integrate our cloud-based solutions with your most important on-premises systems.

Active Directory / LDAP

HighQ syncs users and groups from AD or LDAP servers so that you can streamline your user management and leverage security groups to reduce administration and minimize risk.

Microsoft SharePoint

SharePoint document libraries, including custom metadata, can be synchronized with the Files and iSheets modules in HighQ to support document sharing between the systems.

Microsoft iManage Work

HighQ provides comprehensive integration with iManage Work so users can upload files and folders directly from within the native WorkSite or FileSite interfaces with a simple right click.

CMIS

HighQ supports the CMIS standard which enables integration with any other document management system or content repository that also supports it.

ML/

The XML/RSS connector allows news and other updates that can be exposed as XML, RSS, or iCalendar feeds to be imported into the Blog or Events modules from other sources.

SQL Server

The SQL database connector allows you to pull structured data in from other sources by mapping SQL tables to iSheets and publishing your structured data in the cloud.
